the demands orlong-term carestaff who provide care toresidents with ADRD-lowever,manyof these medication-baveadverse effects This has led to a search fononpharmacological interventions There is much evidence for the benefit of individual music interventions. However, there is a lack of research on group musicapproaches a care settings.

Thismixed-methods study aimed to assess the use of group musicintervention to reduce agitation amongpeople in long term care with ADRD

HOW THISTUD WAS CONDUCTED

The study sample consisted 222 residents with ADRD in two assisted in communities (ALCs) and two adult day centers (ADCs) he intervention involved 12 essions of 50 minutes

Data Analysis:

Descriptive statistics were calculated for each variable. Data collected on agitation were analyzed using inear mixed effects models Interview transcripts were analyzed by line to identify themesof interest, such as benefits and barriers

<u>FINDING</u>S

The final study sample included 19 people after 3 dropped out. The majority of the participants were women and nor Hispanic White. The can age was 83 About one-third of participants reported a diagnosis of Alzheim redisease and a majority were at a modrate stage.
